The present invention is directed to a photoconductive switch module. The photoconductive switch module comprises a first substrate having lightemitting elements, a second substrate having photoconductive switch elements, whose number is equal to that of the light-emitting elements. The lightemitting elements face the photoconductive switch elements so that the photoconductive switch elements are turned on/off in accordance with lighting/ distinction of the light-emitting elements. photoconductive switch module further comprises a third substrate arranged between the first substrate and the second substrate. The third substrate has through holes, whose number is equal to that of the lightemitting elements. Drive light emitted from a light-emitting element is trapped within a through hole to travel to a photoconductive switch element. first substrate and the third substrate are connected to each other by heating and pressure contacting of first metal members.
